# Linked List operations:

- Add node to end of list

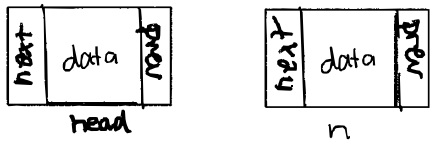

void push_back(const T& data):

① if first node, call add_node:

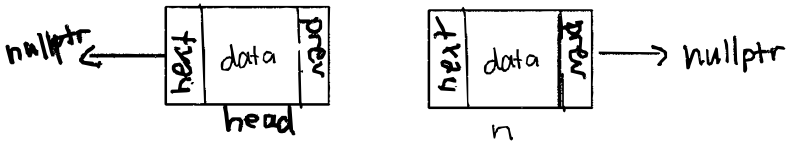

else:

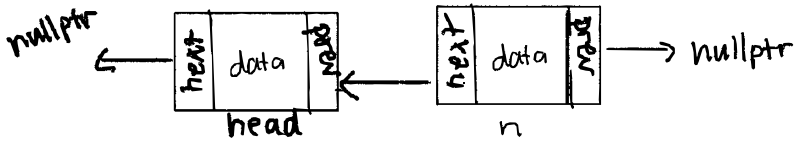

② Create new node, n

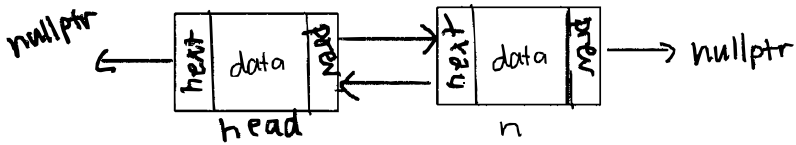

③ point n's prev / head's next to nullptr

④ point n's next to head

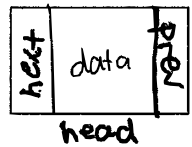

⑤ point head→prev to n

- Add node to beginning of list

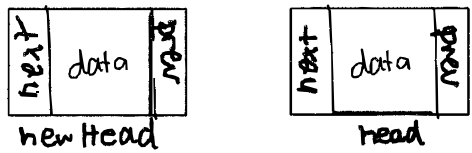

void push_front(const T& data):

① if first node, call add_node:

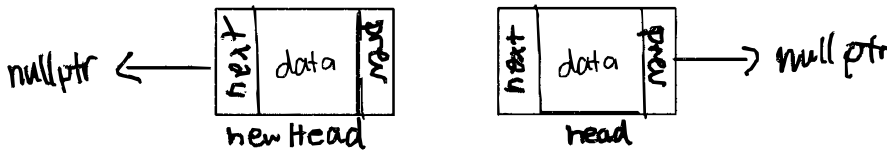

else:

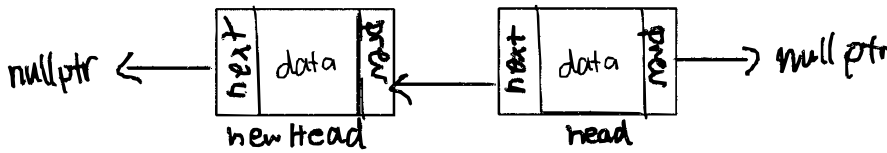

② Create new node, newHead

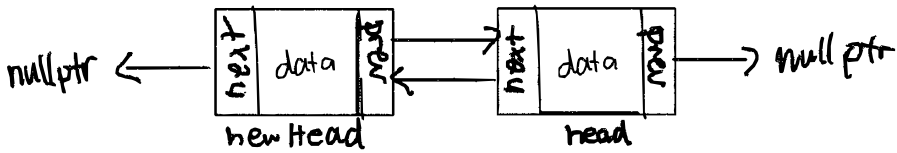

③ point newHead->next / head->prev to nullptr

④ point head->next to newHead

⑤ point newHead->prev to head

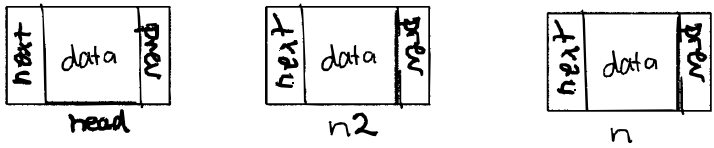

. Add node somewhere between

void insert_node(const T& data):

if linkedlist has more than 1 node

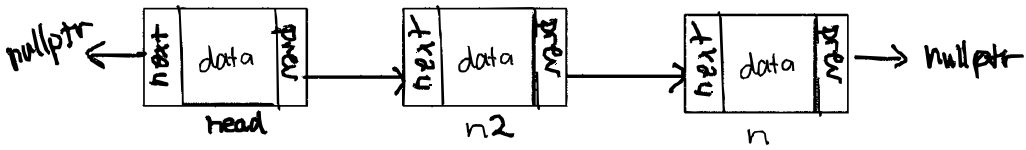

① Create a node, n2

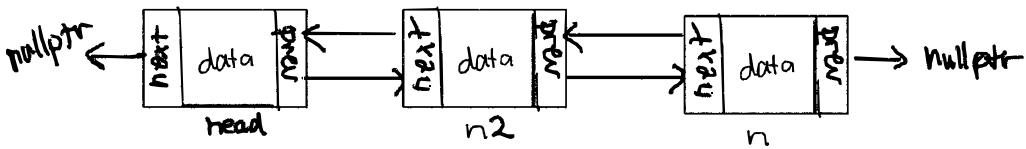

② point n's prev / head's next to nullptr

③ point head->prev to n2 / n2->prev to n

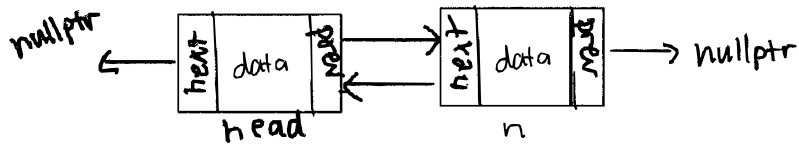

④ point n->next to n2 / n2->next to head

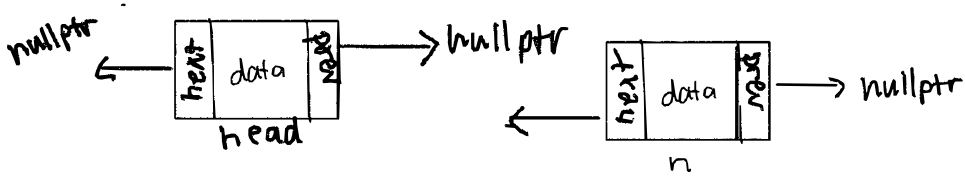

- Remove node from list

void delete_node (const T & data)

if linkedlist has more than 1 node

(1) point head -> prev to nullptr

(2) delete n
